Answers to the following questions are provided in the analysis:

- What are the most frequent and salient terms in the corpus?
- Is the corpus primarily economic, social, or policy-oriented?
- How is poverty conceptualized (measurement, social exclusion, inequality)?
- Which dimensions of poverty receive the most attention?
- What themes co-occur with poverty-related terms?

- How do documents differ in their thematic focus?
- Which texts emphasize measurement, policy, or social aspects more strongly?
- Are some documents more technical or more people-centered?
- Which concepts are most closely associated with which documents?
- How are key terms positioned relative to one another?
- Are there clusters of documents with similar conceptual orientations?
- Is poverty discussed at a global, national, or local level?
- How often are cross-country comparisons emphasized?
- Which scale dominates the discourse?
- Is poverty discussed more in economic or social terms?
- How prominent are inequality, inflation, education, and gender?

The analysis with tools:

The SketchEngine analysis:

Keywords results:

1 poverty line	14 cost of basic needs	27 WBG 2022b	40 living standard
2 global poverty	15 poverty gap	28 national account statistic	41 price datum
3 social exclusion	16 CBN poverty line	29 Poverty Gap Index	42 Watts index
4 household survey	17 extreme poverty	30 PPP exchange rate	43 National Accounts variant
5 poverty rate	18 CBN method	31 PPP exchange	44 poverty severity
6 international poverty	19 Sala-i Martin	32 global poverty rate	45 PPP term
7 international poverty line	20 Gini index	33 account statistic	46 World Bank
8 poverty estimate	21 Head Count Index	34 national poverty line	47 global poverty research
9 CBN poverty	22 DAD method	35 social inclusion	48 global poverty estimate
10 poverty measurement	23 multidimensional poverty	36 national account	49 poverty line value
11 Mixed household	24 basic need	37 national poverty	50 definition of the poverty
12 absolute poverty	25 global poverty measurement	38 income distribution	
13 dollar-a-day approach	26 Sen Index	39 relative poverty	

The keyword set reveals a corpus centered on global poverty measurement, dominated by monetary indicators, institutional frameworks, and comparative methodologies, while also engaging with multidimensional and social perspectives on poverty.

N-grams:

6-grams, word (items: 32 , total frequency: 68)

N-gram	Frequency	N-gram	Frequency
1 the cost of basic needs approach	4	17 the World Bank Commission on Global	2

15 relationship between poverty and social exclusion	2	31 World Bank Commission on Global Poverty	2
16 represents the minimum amount of money	2	32 National Accounts variation of the dollar-a-day	2

The N-gram patterns reveal a corpus **dominated by technical, comparative, and institutionally grounded discussions of poverty**, with particular **emphasis on the cost of basic needs approach, poverty line definitions**, and the **relationship between poverty and social exclusion**.

WordSketch results:

modifiers of "poverty"	nouns modified by "poverty"	verbs with "poverty" as object
global global poverty	line poverty line	estimate to estimate poverty
extreme extreme poverty	rate poverty rates	measure measuring poverty
absolute absolute poverty	estimate poverty estimates	define defining poverty
multidimensional of multidimensional poverty	measurement global poverty measurement	experience experience poverty
relative relative poverty	inequality of poverty , inequality , and	end end poverty
CBN CBN poverty	gap the poverty gap	point points higher poverty
SPL global SPL poverty	index poverty index	monitor monitoring poverty
measure measure poverty	reduction global poverty reduction	bring poverty was brought
persistent persistent poverty	research NAS global poverty research	evaluate evaluate the poverty
hand hand , absolute poverty	ratio the poverty headcount ratio	see poverty was seen
non-monetary non-monetary poverty	value poverty line value	identify poverty identified
high higher CBN poverty	level poverty levels	develop developed its poverty

The modifiers show that the dataset adopts a **technical and analytical approach**, distinguishing poverty by intensity (extreme vs. higher), methodology (CBN, SPL), dimensions (monetary vs. non-monetary), and temporal persistence. This confirms that poverty is **not defined simplistically**, but categorized using established academic and institutional frameworks. The nouns modified by *poverty* overwhelmingly relate to **measurement, indicators, and evaluation**, reinforcing a data-driven discourse. This pattern shows that poverty is primarily discussed as something that can be measured, indexed, compared, and monitored over time. The frequent association with technical indicators suggests a **strong institutional and policy-oriented orientation**, typical of global development and World Bank–style discourse. These verbs show

that poverty is simultaneously an object of scientific analysis and a target of policy intervention. The presence of ‘*experience poverty*’ balances the technical discourse by acknowledging poverty as a **lived condition**, while verbs like *end* and *monitor* reflect **normative goals and institutional responsibility**. Overall, the SketchEngine analyses reveal that poverty in the corpus is framed as a categorized, measurable, and governable phenomenon. The frequent use of technical modifiers, indicator-based nouns, and analytical verbs demonstrates a strong emphasis on measurement frameworks and policy evaluation, while the inclusion of experiential verbs acknowledges poverty as a lived condition. Together, these patterns confirm the corpus’s alignment with institutional and research-oriented approaches to poverty.

modifiers of "inequality"	nouns modified by "inequality"	verbs with "inequality" as object
status status inequality	measure inequality measures	increase inequality increased
income income inequality	study inequality studies	answer inequality are answered
lifetime lifetime inequality	polarization poverty , inequality , economic polarization , and social	measure Measuring Inequality
between-countries between-countries inequalities	platform Inequality Platform	exacerbate exacerbates many existing inequalities
carbon carbon inequality	sentiment inequality sentiments	ignite ignited social inequalities
wealth and wealth inequalities	affect inequality affect	spread spreading further inequality
Poverty Poverty , Inequality , and Social	Lyubimov inequality , Lyubimov	recognize recognizes the lifetime inequality
poverty of poverty , inequality , and	measurement inequality measurement	maintain inequality is maintained
high high inequality	methodology inequality methodologies	keep keeping inequality
internal internal inequality	report inequality report	monitor inequality is monitored
surge surge status inequality	indices inequality indices	estimate estimate inequality
intragenerational intragenerational inequalities	aspect inequality aspect	evaluate inequality is evaluated

Here inequality is not framed as a static gap, but as a **dynamic, layered phenomenon** that varies across countries and within societies, accumulates over the life course, and extends beyond income to environmental and status-based dimensions. Inequality is also approached as a **phenomenon requiring formal measurement, standardized indices, and methodological debate**. The inclusion of *sentiment* and *affect* suggests an emerging interest in the **social and psychological consequences** of inequality, though still embedded within an analytical framework. The verbs show that inequality is framed as **a worsening condition** (it increases, spreads, is exacerbated), and **an object of institutional oversight** (it is measured, monitored, evaluated). Compared to poverty, inequality discourse places **greater emphasis on escalation and systemic persistence**, reflecting concern with long-term structural imbalances rather than immediate deprivation alone.

modifiers of "food"	"food" and/or ...	nouns modified by "food"
nutritional nutritional rich food	water food , safe drinking water	component of the food component
enough enough food	energy energy and food	insecurity food insecurity
staple staple food	healthcare food , healthcare	water food , safe drinking water
nutritious nutritious food	sector food and energy sectors	healthcare food , healthcare
healthy healthy food	component food and a non-food component	shelter food , shelter
adequate adequate nutritional food	clothes food , clothes	preparation food preparation
rich rich food	expenditure food and expenditure	clothes food , clothes
basic basic foods	shelter food , shelter	assistance food assistance
	asset food and assets	clothing food , clothing
	clothing food , clothing	category food categories
	people food , people	item food items
		decrease food expenditure decreases

The modifiers indicate that food is conceptualized primarily as a **biological and welfare necessity**, closely tied to health and survival. The emphasis on “enough,” “adequate,” and “basic” shows that the corpus focuses on **minimum standards of living**, consistent with poverty and food-security frameworks rather than consumption or lifestyle narratives. This pattern strongly suggests that food is treated as **one component of a broader basic-needs system**. Poverty is therefore framed not as the absence of a single resource, but as **simultaneous deprivation across interconnected necessities**, reinforcing a multidimensional approach to poverty. The nouns show that food is embedded in **policy design and measurement systems**, particularly in relation to poverty assessment and welfare interventions. The presence of *food insecurity* underscores food’s role as a **key diagnostic indicator** of deprivation, while *expenditure decreases* links food directly to economic shocks and household coping strategies.

Overall, the SketchEngine analyses reveal that food is conceptualized in the corpus as a fundamental component of human welfare, defined by adequacy, nutritional quality, and sufficiency rather than consumption choice. Its frequent association with water, shelter, healthcare, and energy situates food within a broader basic-needs framework, while terms such as food insecurity and food assistance highlight its role as both a key indicator of deprivation and a target of policy intervention.

modifiers of "income"	"income" and/or ...	nouns modified by "income"	verbs with "income" as object
median median income much much income low low income disposable disposable income family family income average average income rich richest average income aggregate aggregate income total total income national national income high higher income household household income	consumption income or consumption distribution income or wealth distribution wealth income , wealth , and survey income or consumption surveys average average , the income accumulation income and wealth accumulation ethnicity lack income , lack level income or consumption levels war income , war polarization income or wealth polarization education income , inadequate education	distribution income distributions inequality income inequality wealth income , wealth , and datum consumption / income data from household surveys dataset income dataset denomination income denomination threshold income threshold earner income earners independence income scale independence lack income , lack growth income growth war income , war	earn earn those incomes generate generate income redistribute redistributing income include including low income lose lost income base income based capture income captured compare compares the average income measure measure income have have incomes be are income

Income is framed as relative to averages and medians, across household and national scales, and in relation to **disposable capacity**, not gross earnings. This reflects an **analytical and policy-oriented use of income**, consistent with poverty measurement practices. Income is tightly linked to **consumption-based poverty measures**, analyzed together with **wealth and inequality**, and sensitive to **structural and contextual shocks** (education deficits, conflict). This

confirms that the corpus treats income as a **mediating variable** between economic structures and lived deprivation. Income is sensitive to macro-level forces such as conflict and functions as a **core input** in poverty and inequality diagnostics.

"inflation" and/or ...	nouns modified by "inflation"
loss loss , inflation	crisis inflation , energy crisis
crisis inflation , energy crisis	change inflation , climate change
issue inflation and other issues	rate the average inflation rate is
change inflation , climate change	

Inflation is conceptualized as part of **overlapping crises**, particularly energy and climate-related disruptions. The reference to *rate* reflects technical measurement, but this appears secondary to inflation's framing as a **problematic and exceptional condition** rather than a standard economic variable. Inflation is also embedded within **chains of adversity**, where inflation contributes to losses, intensifies existing problems, and interacts with environmental and structural change. This positioning frames inflation as a **driver of economic stress** rather than a neutral background condition. Finally, inflation thus functions as an **external pressure** that exacerbates poverty and inequality, increasing the cost of living and undermining household resilience, rather than as a primary focus of economic measurement.

modifiers of "program"

insurance
insurance program
welfare
welfare programs
health
health insurance program
new
new programs
many
many programs
social
social welfare programs

verbs with "program" as object

launch
program launched
initiate
program initiated
support
support programs
develop
develop new programs
make
made , many programs

The SketchEngine analyses show that 'programs' are framed in the corpus as institutional mechanisms for addressing poverty and vulnerability, particularly through welfare and insurance-based interventions. The dominance of modifiers related to social welfare and health insurance, combined with verbs emphasizing program initiation and development, highlights an action-oriented policy discourse. This framing underscores the role of programs as practical tools through which governments and institutions seek to translate poverty measurement and diagnosis into concrete support measures.

modifiers of "method"	"method" and/or ...	verbs with "method" as subject	verbs with "method" as object
dad the DAD method	CBN CBN and DAD methods	sustain method sustains	apply apply these methods
CBN the CBN method	calibration calibration , or any other method	fill method fills	remark REMARKS The two main methods
other other methods	framework method , or measurement frameworks	strike method is less striking	devise method is devised
dollar-a-day the dollar-a-day method	capability method and the capabilities	boil method boils	program programing method
different different method	resource resources and methods	vary methods varies	coin coined the dollar-a-day method
basic basic needs method	datum data and methods	implement method actually implements	try tried several other methods
cost-of-basic-need cost-of-basic-needs method		reach methods reach	interpret method is interpreted
extrapolation extrapolation method		capture captured by the CBN method	use method used
conversion conversion method		appear method appears	run run an indirect method
stratification stratification methods		identify identified by all other methods	regard regarding the CBN method
imputation imputation methods		follow method followed	compare compare methods
indirect indirect method		estimate method estimating	follow method largely followed

The SketchEngine analyses show that methods are treated as foundational and contested instruments in the corpus. The diversity of methodological modifiers and the prevalence of verbs indicating application, comparison, and implementation reveal a reflective approach to poverty measurement. Rather than assuming a single authoritative method, the dataset emphasizes methodological plurality, sensitivity, and the alignment of methods with data, theory, and resources.

Concordance with SketchEngine

Poverty is frequently discussed in relation to **quantitative indicators**, reinforcing a **methodologically grounded discourse** and as both a **cause and consequence of systemic failures**. The presence of multiple indices also signals **comparative evaluation**, where different measures are assessed for their analytical relevance. The KWIC analysis demonstrates that

poverty in the corpus functions as a **nodal concept** that connects measurement practices, social inequality, global development agendas, and structural crises. The consistent coupling of poverty with inequality, social exclusion, and quantitative indicators confirms that the dataset adopts a **multidimensional, institutional, and policy-relevant understanding** of poverty.

The contexts in which *food* appears reveal both its **material role in basic needs** and its **analytical role in poverty measurement frameworks**. The '*food*' is repeatedly associated with safe drinking water, clean energy, warmth, education, and healthcare. The dataset highlights how food costs and consumption patterns are foundational to **poverty lines and headcount ratios**.

The analysis repeatedly links food to inflation, energy crises, war (Ukraine), price destabilization, and rising food prices. These contexts frame food as a **highly sensitive sector** affected by macroeconomic and geopolitical shocks. Rising food prices are explicitly connected to **worsening inequality and poverty persistence**. In addition, food insecurity is presented as both a **symptom and a driver of poverty**, reinforcing cycles of deprivation.

20	doc#2 of global poverty research in terms of the dollar-a-day approach , while section 4 follows the rather recent developmen

The dataset positions poverty as a **normative and philosophical issue**, not only a technical one. The corpus foregrounds **methodological pluralism**, acknowledging that no single approach fully captures poverty. Several KWIC lines emphasize that poverty outcomes are “**largely influenced by the choice of approach**”, especially under conditions of data scarcity, long-run estimation, and cross-country comparison. This highlights that approaches are not neutral tools but **decisive analytical choices** that shape results, rankings, and policy conclusions. Poverty measurement is presented as **approach-dependent**, reinforcing the importance of transparency and justification.

The Voyant tools analysis:

The Voyant analysis demonstrates that poverty discourse in this corpus is not monolithic. Instead, it is structured around competing and complementary perspectives that frame poverty as:

- a measurable economic condition,
- a consequence of structural and environmental factors,
- an outcome of inequality and development processes, and
- a form of social exclusion and marginalization.

Summary:

Questo corpus contiene 6 documenti con 38,258 totale parole e con 4,807 forme di parola uniche. Creato ora.

Lunghezza del documento:

1. Approaches and Challenges

Characteristic words: *PGI, Sen, index, head, tells*

This document is primarily concerned with **theoretical and methodological approaches to measuring poverty**. The prominence of *PGI* (*Poverty Gap Index*), *Sen*, *index*, and *head* indicates a focus on **poverty indices**, particularly the Headcount Index, Poverty Gap Index, and Sen's contribution to poverty measurement. The language suggests an explanatory discussion of **how poverty should be conceptualized and quantified**, rather than why poverty exists. The main focus is on poverty **measurement frameworks and conceptual challenges**.

2. Causes of Poverty

Characteristic words: *disasters, conflict, infrastructure, girls, natural*

This document focuses on structural, environmental, and social causes of poverty. The presence of *disasters*, *conflict*, and *natural* points to environmental shocks and instability, while *infrastructure* highlights systemic development failures. The term *girls* indicates attention to gendered dimensions of poverty, such as unequal access to education and resources. In the document, it is stated that poverty happens as a result of structural, environmental, and gender-related factors.

3. Global Poverty: A Review of Measurement, Levels, and Trends in a Historical Perspective

Characteristic words: *CBN, dollar, survey, Moatsos*

This document is strongly centered on **historical and methodological debates in global poverty measurement**. Terms like *CBN (Cost of Basic Needs)*, *dollar*, and *survey* indicate comparisons between different poverty lines and data sources, while *Moatsos* reflects engagement with specific scholarly contributions. The focus is not on social consequences but on **how global poverty has been measured over time and how estimates differ by method**. Here global poverty measurement is analyzed methodologically.

4. Measures of Poverty and Inequality

Characteristic words: *SDGs, polarization, institutions, aporophobia*

This document links poverty to **inequality, institutions, and global development agendas**. The presence of *SDGs* situates the discussion within international policy goals, while *polarization* highlights widening economic divides. *Institutions* suggest a governance and policy perspective, and *aporophobia* (fear or rejection of the poor) signals engagement with **social and ethical dimensions of inequality**. The center of discussion is poverty within **inequality, institutional structures, and development policy frameworks**.

5. Report: World Bank Poverty Statistics

Characteristic words: *statistics, consumption, 22871, cent*

This document is dominated by poverty monitoring, official statistical and technical reporting language. Words such as *statistics* and *consumption* indicate a focus on data production, measurement standards, and reporting procedures. The presence of numerical references (e.g. *22871, cent*) reflects formal documentation and institutional reporting practices rather than analytical or theoretical debate.

6. Social Exclusion

Characteristic words: *exclusion, percent, blacks, Americans, social*

This document focuses on **poverty as social exclusion and marginalization**, particularly in specific national and demographic contexts. The terms *blacks* and *Americans* suggest a focus on **racialized and national patterns of exclusion**, while *percent* reflects empirical discussion of affected populations. The emphasis is on **who is excluded and how**, rather than on poverty lines or indices.

Topics:

1. Approaches and Challenges

- *poverty global data line measurement estimates approach consumption absolute different*
- *index line person sen average head count means PGI*

This document is primarily concerned with **poverty measurement frameworks and methodological challenges**. The strong presence of terms such as *poverty line*, *estimates*, *consumption*, *headcount*, *PGI*, and *Sen* indicates a technical focus on how poverty is defined, measured, and compared across contexts.

2. Causes of Poverty

- *people poor world countries extreme water resources public government*

- *like education high school time health costs climate jobs sanitation*
- *poverty lack food families access housing children conflict*

This document focuses predominantly on **structural and social drivers of poverty**. Topics emphasize education, health, climate, employment, sanitation, food insecurity, housing, and conflict, framing poverty as the outcome of systemic and environmental factors rather than measurement issues.

3. Global Poverty: A Review of Measurement, Levels, and Trends in a Historical Perspective

- *poverty global data line measurement estimates approach consumption absolute different*
- *welfare national development statistics international consumption monetary goals methods measure*
- *inequality wealth 2022 figure standards million importance core life aspects*

This document combines **measurement debates with long-term development and inequality trends**. It bridges technical discussions of poverty measurement with broader historical perspectives on welfare, wealth distribution, and global development standards.

4. Measures of Poverty and Inequality

- *inequality wealth 2022 figure standards million importance core life aspects*
- *poverty income measures gap population living social economic report below*

This text is centrally concerned with **poverty–inequality linkages and development indicators**. The emphasis on inequality, income gaps, welfare, and population-level measures positions the document within policy-oriented and analytical discussions of economic polarization.

5. Report on World Bank poverty statistics

- *poverty income measures gap population living social economic report below*
- *social section basic al et result bank ravallion hand main*
- *poverty global data line measurement estimates approach consumption absolute different*

The World Bank report is dominated by **official statistical reporting and monitoring language**. It emphasizes income-based measures, population-level indicators, methodological consistency, and institutional approaches to poverty tracking.

6. Social Exclusion

- *exclusion percent issues low policy excluded socially individuals researchers increased*
- *poverty lack food families access united million housing children conflict*

This document is strongly centered on **social exclusion and marginalization**. Topics highlight exclusion, policy impacts, vulnerable groups, housing, food access, and population-specific issues, framing poverty as a process of social and civic exclusion rather than solely economic deprivation.

Contexts:

Global po...	the use of the average	infla...	rate for converting the global
Global po...	sets of products, the average	infla...	rate is still being used
Global po...	The problem with the average	infla...	rate is that it does
There are two main empirical advantages of the CBN methodology against the methodology applied by the World Bank. First, it does not require the use of the average inflation rate for converting the global poverty line for years other than each PPP/ICP benchmark year. The problem with the average inflation rate is that it does not necessarily correspond to the price changes faced by those living in conditions of poverty. And second, it does not assume that the PPP conversion correctly converts monetary amounts that would correspond to the expenditure patters of those living below the poverty line. The advantage			
Causes o...	unexpected medical bills, job loss,	infla...	and other issues. Without enough
respond; in the United States, there is no state, county or metro area where the federal minimum wage allows a full-time worker to afford a two-bedroom rental. With so much income going towards housing, people lack a financial buffer that protects them from unexpected medical bills, job loss, inflation and other issues. Without enough affordable housing options, poverty will persist. 8. Gender discrimination About 388 million women and girls lived in extreme poverty in 2022 compared to 372 million men and boys. Gender discrimination is one of the primary drivers. For example, 2021 data from Chad found that around			
Measure...	described as an era of	infla...	, energy crisis, pandemic, and war
issue of better understanding the SDGs and vice versa. The SDGs could be a helping hand in dealing with poverty and inequalities, as the sub-targets of SDGs embody great potential in eradicating these phenomena. 4. Policy Implications and Conclusions The present times can be described as an era of inflation , energy crisis, pandemic, and war. These driving forces delay, postpone, and even disrupt pathways towards sustainability. However, political will seems to have achieved a greater percentage of people who have access to basic utilities, in contrast to the 20th century. In essence, the coverage of needs, as stated by Maslow			
Measure...	exclusion? In an era of	infla...	, climate change, and war, such
clean energy, proper education, satisfactory healthcare, and inclusive institutions. Poverty, inequalities, and social exclusion could create a hiatus between people and a decent life; hence, the monitoring of these phenomena is of utmost importance. In essence, which are the causes of poverty, inequality, and social exclusion? In an era of inflation , climate change, and war, such ordeals take place overall and might also derail Agenda 2030 targets. Inflation destabilizes—energy and food—prices, spreading further inequality in modern societies (CSRI 2022; Ha et al. 2021). The World Bank warned that, on the eve of 2023, there were almost 700 million people			
Measure...	also derail Agenda 2030 targets.	infla...	destabilizes—energy and food—prices
hiatus between people and a decent life; hence, the monitoring of these phenomena is of utmost importance. In essence, which are the causes of poverty, inequality, and social exclusion? In an era of inflation, climate change, and war, such ordeals take place overall and might also derail Agenda 2030 targets. Inflation destabilizes—energy and food—prices, spreading further inequality in modern societies (CSRI 2022; Ha et al. 2021). The World Bank warned that, on the eve of 2023, there were almost 700 million people under the status of extreme poverty, and this trend might reach a little below 600 million people			

The keyword-in-context analysis shows that *inflation* plays a multifaceted role in poverty discourse across the corpus. In measurement-focused texts, inflation is treated primarily as a methodological issue, where the use of average inflation rates is criticized for failing to reflect the price changes experienced by people living below the poverty line, potentially distorting global poverty estimates. In these contexts, inflation is linked to technical concerns surrounding PPP conversion, poverty lines, and the Cost of Basic Needs approach.

In contrast, in texts addressing the causes of poverty, inflation is framed as a direct socioeconomic risk that reduces household purchasing power and increases vulnerability, particularly when combined with high housing costs, job insecurity, and unexpected medical expenses. Inflation is presented as a factor that limits households' ability to cope with economic shocks and contributes to the persistence of poverty.

Within policy- and development-oriented documents, inflation is discussed as a systemic macroeconomic force associated with contemporary global crises, including energy shocks, pandemics, climate change, and war. In these contexts, inflation is portrayed as a destabilizing factor that exacerbates inequality, disrupts pathways toward sustainability, and threatens progress toward the Sustainable Development Goals.

Finally, in social exclusion–focused texts, inflation emerges as a multiplier of social disadvantage, intensifying food and energy price pressures and disproportionately affecting already marginalized populations. Overall, the corpus demonstrates that inflation is not a neutral background variable but a central explanatory mechanism that intersects with poverty measurement, household vulnerability, inequality, and social exclusion.

Measure...	in peril due to poverty,	ine	, economic polarization, and social exclusion
Measure...	can be totally connected to	ine	sentiments in terms of social

The keyword-in-context analysis shows that *inequality* is treated as a **central and structurally embedded concept** rather than a standalone outcome. Across the examined contexts, inequality consistently appears alongside poverty and social exclusion, indicating that these phenomena are understood as **interdependent and mutually reinforcing**. The discourse frames inequality not

only in economic terms but also across psychological, institutional, and macro-level dimensions, highlighting its multidimensional character.

The analysis further reveals a strong emphasis on **measurement and conceptual rigor**, with repeated references to the construction and consistency of poverty and inequality measures. Inequality is portrayed as highly sensitive to methodological choices, and inadequate or narrowly defined indicators are presented as risks that can obscure the true extent of disadvantage.

In addition, inequality is frequently linked to **economic polarization**, where widening gaps in income and wealth create persistent barriers to education, social inclusion, and long-term opportunity. Within policy-oriented contexts, inequality is positioned as a major constraint on effective poverty reduction and as a key challenge for achieving the Sustainable Development Goals. Overall, the findings indicate that inequality is understood as both a **driver and a consequence of poverty**, playing a fundamental role in shaping social exclusion and development outcomes.

Overall, the findings show that inequality is conceptualized not as a secondary outcome but as a **central analytical and policy challenge**, essential to understanding poverty persistence and to designing effective strategies for achieving Agenda 2030.

Causes o...	on job options, a 20% gen... wage gap and less access
well, while about 61% of women aged 20-24 years old married before their 18th birthday. A lack of education and early marriage, which affects women more than men, both link to higher risks of poverty in Chad and around the world. Globally, legal restrictions on job options, a 20% gender wage gap and less access to land ownership contribute to gendered poverty, as well.	
9. Racial discrimination	
People belonging to oppressed racial groups often experience poverty at a higher rate than others. South Africa represents a harrowing example. From 1948-1994, South Africa lived under apartheid, a system of racial	
Causes o...	too-few teachers, war and gen... discrimination can limit someone's education
people can't access good schooling, they can't qualify for decent-paying jobs. In many areas of the world, people aren't getting educated. The reasons why vary. Oftentimes, kids from poor families are pulled from school so they can work, but a lack of school funds, too-few teachers, war and gender discrimination can limit someone's education, too. According to UNESCO, the exclusion of girls from Afghanistan's schools and global stagnation in 2023 meant 250 million kids weren't getting the education they deserved.	
3. War and conflict	
According to the United Nations, 455 million people experiencing poverty live in conflict settings. Economic	
Causes o...	372 million men and boys. gen... discrimination is one of the
towards housing, people lack a financial buffer that protects them from unexpected medical bills, job loss, inflation and other issues. Without enough affordable housing options, poverty will persist.	
8. Gender discrimination	
About 388 million women and girls lived in extreme poverty in 2022 compared to 372 million men and boys. Gender discrimination is one of the primary drivers. For example, 2021 data from Chad found that around 24% of boys completed lower secondary school compared to just 14% of girls. Adult literacy is lower for women than men, as well, while about 61% of women aged 20-24 years old married	

The keyword-in-context analysis shows that **gender discrimination is framed as a major structural driver of poverty**, rather than a secondary or peripheral issue. Across the examined excerpts, gender inequality is consistently linked to **restricted access to education, employment, and economic resources**, which in turn increases women's and girls' vulnerability to poverty.

The contexts highlight that **educational exclusion** plays a central role: gender discrimination limits access to schooling through factors such as early marriage, lack of school funding, war, and cultural barriers. Girls are disproportionately affected, as evidenced by lower secondary school completion rates and higher rates of early marriage, which significantly reduce long-term income opportunities.

Gender discrimination is also connected to **labor market inequality**, including legal restrictions on job options, a persistent gender wage gap, and reduced access to land ownership. These constraints systematically weaken women's economic independence and resilience to shocks such as inflation, job loss, or medical expenses.

The KWIC evidence further emphasizes that gendered poverty operates **at a global scale**, affecting both low-income and conflict-affected regions. Statistics comparing women and men living in extreme poverty reinforce the argument that poverty is not gender-neutral but **disproportionately affects women and girls** due to structural disadvantages.

Overall, the analysis positions gender discrimination as a **core mechanism through which poverty is reproduced**, intersecting with education systems, labor markets, legal institutions, and conflict settings. Addressing poverty effectively therefore requires policies that directly confront gender-based inequalities rather than treating them as indirect or incidental factors.

Trends:

Dominance of the Term *Poverty*

Across all documents, *poverty* is the most frequently occurring term, confirming that it constitutes the central conceptual anchor of the corpus. Its highest relative frequencies appear in *Approaches and Challenges*, *Global Poverty: A Review of Measurement, Levels, and Trends in a Historical Perspective*, and the *World Bank Poverty Statistics Report*. This indicates a strong and explicit focus on poverty itself, particularly in documents concerned with definition, measurement, and monitoring.

Measurement and Methodological Orientation

The terms *income* and *method* are most prominent in *Approaches and Challenges*, *Global Poverty: A Review...*, and the *World Bank Poverty Statistics Report*. This pattern reflects a measurement-oriented discourse, where poverty is primarily discussed through income-based indicators, methodological choices, and analytical frameworks. The elevated presence of *method*

in these texts underscores their concern with how poverty is calculated, compared, and interpreted.

Structural and Social Dimensions

In *Causes of Poverty*, the relative frequencies of *food*, *education*, and *gender* are noticeably higher than in other documents. This indicates that this text frames poverty largely in terms of structural and social drivers, such as food insecurity, educational exclusion, and gender discrimination, rather than methodological issues. The prominence of *education* and *gender* highlights the role of unequal access to human capital and systemic discrimination in the reproduction of poverty.

Inequality-Focused Discourse

The term *inequality* shows its strongest relative presence in *Measures of Poverty and Inequality*, confirming the document's explicit analytical focus. While inequality also appears in other texts, its comparatively higher frequency here suggests a theoretical and policy-oriented treatment of poverty that emphasizes distributional outcomes, polarization, and broader socio-economic disparities.

Policy and Institutional Perspective

The term *policy* appears most visibly in *Measures of Poverty and Inequality* and the *World Bank Poverty Statistics Report*. This pattern indicates a stronger engagement with institutional responses, governance, and policy frameworks in these documents, aligning poverty analysis with development agendas and policy interventions rather than purely descriptive accounts.

Inflation as a Contextual Stressor

The term *inflation* appears at relatively lower frequencies across the corpus but is most visible in *Measures of Poverty and Inequality* and the *World Bank Poverty Statistics Report*. Its distribution

suggests that inflation is treated as a contextual macroeconomic factor, relevant to poverty and inequality but not the primary analytical focus of most documents.

Social Exclusion Perspective

In *Social Exclusion*, while *poverty* remains prominent, the comparatively lower emphasis on *method* and *income*, combined with the presence of *inequality*, *policy*, and *inflation*, indicates a framing of poverty as a social and institutional process rather than a narrowly economic condition.

The figure demonstrates that while poverty is the shared focal point across all documents, **each text emphasizes different dimensions of the phenomenon:**

- measurement and income-based analysis in technical and institutional reports,
- structural and social drivers in causal explanations,
- inequality and policy considerations in development-oriented texts.

This distribution reinforces the conclusion that poverty in the corpus is treated as a **multidimensional phenomenon**, encompassing economic measurement, social exclusion, inequality, and policy response rather than a single, unified concept.

Mandala

The term–document network visualization demonstrates that **poverty is the central organizing concept** across the entire corpus, acting as a hub that connects all documents regardless of their analytical focus. Its strong and consistent links confirm that poverty functions as a shared conceptual anchor uniting methodological, social, and policy-oriented perspectives.

A prominent **measurement-focused cluster** emerges around terms such as *income*, *line*, *estimates*, *data*, and *global*, which are strongly associated with documents concerned with poverty measurement and monitoring. This cluster highlights an emphasis on **quantification, comparability, and methodological rigor**, particularly in texts addressing global and national poverty estimation.

The visualization also reveals a distinct **social and people-centered dimension**, reflected in strong connections between terms such as *social* and *people* and documents focusing on social exclusion and structural causes of poverty. This indicates that poverty is not only treated as a measurable economic condition but also as a **social process affecting lived experiences and marginalization**.

In addition, terms such as *national* and *countries* point to a **policy and governance perspective**, showing that poverty is analyzed across different territorial scales and framed as a challenge requiring institutional and state-level responses.

Overall, the network structure highlights the **multidimensional nature of poverty discourse**, where measurement, social experience, and policy considerations are closely interconnected. Rather than competing interpretations, these dimensions jointly shape how poverty is understood and addressed within the corpus.

ScatterPlot

The correspondence analysis reveals a **strong and interpretable conceptual structure** within the corpus. The first two dimensions explain a substantial proportion of the total association in the data (**Dimension 1: 37.96%; Dimension 2: 28.36%**), together accounting for over **66% of the explained variance**, indicating that the visual configuration meaningfully captures the main patterns of term–document relationships.

Dimension 1 (X-axis): Measurement–Technical vs. Social–Experiential Framing

The first dimension primarily separates **measurement-oriented and technical discourse** from **social and experiential interpretations of poverty**. On the left side of the axis are cluster terms such as *measurement*, *survey*, *CBN*, *statistics*, *global*, and *rates*, closely associated with *Global Poverty: A Review of Measurement...* and the *World Bank Poverty Statistics Report*. This side reflects an emphasis on **methodology, quantification, and comparability**.

On the right side, terms such as *people*, *poor*, *inequality*, and *index* appear closer to *Approaches and Challenges*, *Causes of Poverty*, and *Measures of Poverty and Inequality*, indicating a shift toward **human-centered, distributional, and conceptual discussions** of poverty.

Dimension 2 (Y-axis): Monetary–Economic vs. Social Exclusion Perspective

The second dimension distinguishes **monetary and economic interpretations of poverty** from a **social exclusion framework**. Lower positions on the axis are associated with terms such as *income*, *line*, *average*, and *country*, reflecting income-based poverty measurement. Higher positions are dominated by *social* and *exclusion*, strongly linked to the *Social Exclusion* document, highlighting poverty as a process of **marginalization, exclusion, and institutional disadvantage**.

Positioning of Key Documents

- **Global Poverty: A Review of Measurement, Levels, and Trends in a Historical Perspective** and **World Bank Poverty Statistics Report** are positioned near technical and measurement terms, confirming their methodological orientation.
- **Measures of Poverty and Inequality** occupies an intermediate position, bridging measurement language with concepts such as *inequality* and *population*.
- **Causes of Poverty** aligns closely with the core term *poverty* and contextual factors, emphasizing drivers and lived conditions.
- **Social Exclusion** is clearly separated from income-based discourse, strongly associated with *social* and *exclusion*, underscoring its distinct conceptual framing.

Overall Interpretation

Overall, the correspondence analysis demonstrates that poverty discourse in the corpus is **not homogeneous**, but structured along two principal dimensions:

1. **how poverty is measured** (technical vs. experiential), and
2. **how poverty is conceptualized** (monetary deprivation vs. social exclusion).

This confirms that poverty is treated as a **multidimensional phenomenon**, where methodological, economic, and social perspectives coexist and intersect rather than compete.

Cirrus

The term *poverty* is by far the most prominent element in the visualization, confirming its role as the **central organizing concept** of the corpus. Its overwhelming size relative to other terms indicates that the dataset is tightly focused on poverty rather than using it as a peripheral or background topic. This supports the validity of the corpus as a specialized poverty-focused dataset.

Large and highly visible terms such as *data*, *estimates*, *line*, *surveys*, *consumption*, and *household* indicate a strong emphasis on **quantitative measurement and statistical approaches**. These terms suggest that poverty is frequently discussed in relation to:

- poverty lines,
- household consumption,
- survey-based estimates, and
- data-driven methodologies.

The prominence of *countries*, *global*, *international*, and *national* highlights that poverty is primarily framed as a **comparative and multi-scalar phenomenon**. The corpus consistently states poverty within both global and national contexts, emphasizing cross-country comparison and policy relevance rather than localized or purely anecdotal accounts.

Terms such as *inequality*, *social*, *people*, *poor*, *food*, and *exclusion* demonstrate that poverty is not treated solely as an economic statistic. Instead, the discourse integrates **social and distributional dimensions**, linking poverty to inequality, social exclusion, and basic needs such as food access. This indicates an awareness of poverty as a **lived social condition**, not merely a numerical threshold.

The presence of words such as *World*, *bank*, *approach*, and *used* suggests a strong influence of **institutional frameworks and policy-oriented analysis**, particularly those associated with international organizations. This reinforces the interpretation that the corpus combines academic discussion with institutional reporting and policy guidance.

The Cirrus visualization shows that poverty discourse in the corpus is characterized by the interaction of three main dimensions:

1. **Measurement and data** (poverty lines, surveys, estimates),
2. **Scale and comparison** (global, national, countries), and
3. **Social consequences** (inequality, exclusion, people, food).

Document Terms

This table presents a set of **low-frequency but semantically salient terms** in the poverty corpus. Although these words are not among the most frequent overall, their presence is analytically important because they reflect **contextual, evaluative, and crisis-related dimensions** of poverty discourse.

Terms such as *epidemic*, *emergency*, *failure*, and *extremes* point to a discourse that frames poverty in relation to **crises, disruptions, and systemic breakdowns**. Even at low frequency,

these words suggest that poverty is often discussed as a condition intensified by extraordinary events (e.g. health crises, emergencies, or extreme conditions), rather than as a static or isolated phenomenon.

The appearance of *expensive* highlights attention to **cost-related pressures**, implicitly linking poverty to rising prices and affordability constraints. This aligns with broader discussions in the corpus concerning inflation, consumption, and household expenditure, indicating that poverty is frequently contextualized within economic stress rather than purely income insufficiency.

Words such as *effectively*, *effort*, *enabling*, *eliminate*, and *establishing* reflect a **normative and policy-oriented register**. These terms indicate that poverty discourse does not merely describe conditions but also emphasizes **intervention, effectiveness, and solutions**, reinforcing the applied and policy-relevant nature of the corpus.

The presence of *environment* and *emissions* suggests that poverty is occasionally linked to **environmental and climate-related factors**, supporting the interpretation that the corpus acknowledges structural and global drivers beyond traditional economic explanations.

The trend lines show that these terms are **unevenly distributed across texts**, rather than concentrated in a single document. This pattern indicates that crisis-related and evaluative language appears across multiple sources, reinforcing the idea that such concerns are **shared across different perspectives** rather than confined to one specific report.

This table presents **frequent and semantically central terms** in the poverty corpus, along with their distribution trends across documents. Unlike the low-frequency terms discussed earlier, these words occur more regularly and therefore represent the **core lexical backbone** of the discourse.

The prominence of the term *lack* (highlighted) is particularly revealing. Its frequent occurrence indicates that poverty is predominantly framed as a condition of **deprivation**, emphasizing the absence of essential resources rather than solely low income. This aligns with the frequent co-occurrence of terms such as *food*, *education*, *income*, and *household*, suggesting that poverty is discussed in relation to unmet basic needs at both individual and household levels.

Similarly, the term *poor* reinforces a **people-centered framing**, indicating that the corpus consistently focuses on affected populations rather than abstract indicators alone.

Terms such as *estimates*, *surveys*, *statistics*, *average*, and *approach* appear with high frequency and relatively stable trends across documents. This pattern confirms that poverty is extensively

examined through **quantitative and methodological lenses**, relying on survey data, statistical averages, and formal estimation techniques.

The visibility of *PGI*, *below*, and *line* further indicates sustained attention to **poverty thresholds and indices**, reinforcing the importance of measurement frameworks in defining and comparing poverty levels.

The frequent appearance of *countries*, *people*, *households*, and *United* highlights the **comparative and international scope** of the corpus. Poverty is repeatedly contextualized across countries and populations, underscoring a global perspective rather than a localized case-study approach.

Terms such as *education*, *families*, and *development* point to a broader understanding of poverty that extends beyond immediate economic hardship. Their inclusion suggests that poverty is discussed as a **developmental challenge**, linked to long-term human capital formation and social well-being.

The trend lines show that these key terms are **distributed across multiple documents**, rather than being concentrated in a single source. This indicates a shared conceptual framework across the corpus, where deprivation, measurement, and development concerns recur consistently in different texts.

Overall, this analysis demonstrates that the poverty corpus combines two dominant discursive strands:

1. **Deprivation-based framing**, emphasizing lack of food, income, education, and basic household resources; and
2. **Evidence-based analysis**, grounded in surveys, estimates, and statistical approaches.

The interaction of these strands confirms that poverty is treated as both a **lived condition of deprivation** and a **measurable socio-economic phenomenon**, reinforcing its multidimensional character within the corpus.

The AntConc analysis:

Cluster results with AntConc:

	Cluster	Rank	Freq	Range
1	policy research working paper no washington	1	2	1
2	policy additionally the article compares the	2	1	1
3	policy based axioms for inequality measurement	2	1	1
4	policy can be realized only through	2	1	1
5	policy directions the rapid framework emphasizes	2	1	1
5	policy discussion and debates is severely	2	1	1
7	policy for example a government might	2	1	1
3	policy implications and conclusions are illustrated	2	1	1
3	policy implications and conclusions the present	2	1	1
10	policy implications that ought to be	2	1	1
11	policy initiative in which academicians business	2	1	1
12	policy initiatives designed to narrow the	2	1	1
13	policy initiatives such as the new	2	1	1
14	policy makers among the various options	2	1	1
15	policy pathways in the national and	2	1	1
16	policy recommendations on issues of national	2	1	1
17	policy reforms hence the strengthening of	2	1	1
18	policy reforms on impoverished people such	2	1	1

In the cluster results above, the word ‘policy’ has been used in relation to diverse terms including initiative, implication, direction, reform, pathway, recommendation, research, each of which encompasses different meanings:

1. policy initiatives.. - Poverty is something that *initiatives address or mitigate*.
2. policy implications.. - Poverty generates *implications* for policy, rather than being acted upon directly.
3. policy directions.. - Poverty informs *where policy should go*.
4. policy reforms.. - Poverty is framed as a problem requiring *systemic reform*.
5. policy pathways.. - Poverty reduction is seen as a *process*, not a single action.
6. policy recommendations.. - Poverty research leads to *recommendations*.
7. policy research.. - Poverty is something to be *studied, measured, and interpreted*.

The AntConc clusters reveal that poverty is framed as a policy-relevant problem addressed through research, translated into implications and recommendations, and operationalized via initiatives, reforms, and strategic pathways, with each term performing a distinct and non-interchangeable role.

	Cluster	Rank	Freq	Range
1	income a key methodological issue here	1	1	1
2	income accounts are highly standardized and	1	1	1
3	income across the population in the	1	1	1
4	income americans particularly hard unemployment reached	1	1	1
5	income among two individuals from different	1	1	1
6	income amongst middle income families decreased	1	1	1
7	income and caloric intake the poverty	1	1	1
8	income and consumption are often treated	1	1	1
9	income and consumption can be considered	1	1	1
10	income and consumption data for the	1	1	1
11	income and consumption distributions used for	1	1	1
12	income and consumption journal of human	1	1	1
13	income and consumption measures from national	1	1	1
14	income and consumption niño zarazúa et	1	1	1
15	income and if everyone s income	1	1	1
16	income and measures poverty across several	1	1	1
17	income and non monetary welfare and	1	1	1
18	income and the poverty line it	1	1	1
19	income and upper middle income countries	1	1	1
20	income and wealth accumulation and carbon	1	1	1
21	income and wealth inequalities it further	1	1	1
22	income and wealth inequalities show the	1	1	1
23	income and wealth vol no december	1	1	1

Income is framed primarily as a **methodological concern** rather than a simple descriptor. It is also shown that income is directly linked to **poverty line construction** and classification and **functions as a boundary-setting variable** in poverty identification. The cluster analysis shows that income is treated as a key but methodologically debated indicator, closely linked to consumption, poverty lines, and inequality, and consistently evaluated alongside non-monetary dimensions of welfare.

Collocate with AntConc:

	Collocate	Rank	FreqLR	FreqL	FreqR	Range	Likelihood	Effect
1	insurance	1	3	3	0	1	28.648	8.254
2	president	2	2	0	2	1	19.065	8.254
3	comparison	3	2	2	0	1	14.013	6.446
4	healthcare	4	2	1	1	1	13.738	6.347
5	new	5	2	1	1	2	11.561	5.553
5	health	6	2	2	0	1	11.413	5.499

The ‘program’ is linked to *insurance*, *healthcare*, *health*, which shows that the solutions are meticulously taken into consideration in order to upgrade the living standards of people. The collocations highlight that poverty in the dataset is strongly **linked to policy responses, political leadership, healthcare access, and insurance-based protection**, and is often discussed through comparison and **reform-oriented language**.

The KWIC analysis demonstrates that multidimensional poverty is framed as a formalized, index-based approach—centered on the MPI—that complements income measures by **capturing overlapping deprivations in health, education, living standards, and social vulnerability**.

Conclusion

This project applied a mixed-methods corpus-based approach to the analysis of a poverty-focused dataset using SketchEngine, Voyant Tools, and AntConc, enabling both quantitative and qualitative exploration of discourse patterns. Through frequency analysis, keyword extraction, collocation analysis, and distributional visualizations, the study revealed that poverty is consistently framed in relation to structural factors such as income, inequality, employment, policy intervention, and social support rather than as an individual failing. Temporal and contextual patterns demonstrated that discussions of poverty are closely linked to themes of reform, development pathways, and institutional responsibility, highlighting a predominantly systemic and policy-oriented narrative. The convergence of results across the three tools strengthens the validity of the findings, as recurring lexical patterns and semantic associations emerged regardless of methodological differences. Overall, the analysis demonstrates the effectiveness of digital text analysis tools in uncovering hidden structures within large textual datasets and confirms that poverty discourse is shaped by economic, political, and social dimensions that extend beyond individual circumstances. This study thus contributes to digital humanities and social research by illustrating how corpus linguistics tools can be used to critically examine complex socio-economic phenomena such as poverty.
